Bootstrap PHP web page

Modify index.php to contain a navbar, carousel, and cards. Cards will be generated from PHP code that will read an array of objects (title, imagePath and description) and parse each object to a separate card. CDN to Bootstrap 4 are already linked and can be used.

- o Add Nav bar to top of the page with Home button
- o Add a revolving carousel with 3 images in carousel folder
- o Write PHP code that will iterate through array and add a card for each object with a max of 3 cards per row. Each card will contain a title, image and a description. The value of title is the name of animal and description can be any fact about the animal. The logic should be flexible on the size of array and change accordingly.
