

Que):Create a function component called Greeting that takes a name prop and displays a personalized greeting message. For example, create a function component called Greeting that accepts a name prop. The component displays a personalized greeting message by using the props.name value within curly braces {}.

ANS:

```
import React from 'react';

const Greeting = (props) => {

  return (

    <div>

      <h1>Hello, {props.name}!</h1>

    </div>

  );

};

export default Greeting;
```

App.js

```
import React from 'react';

import Greeting from './Greeting';

function App() {

  return (

    <div>

      <Greeting name="John" />

    </div>

  );

}
```

```
<Greeting name="Alice" />
```

```
<Greeting name="Bob" />
```

```
</div>
```

```
);
```

```
}
```

```
export default App;
```
